

# Aluminum Outswing Sectional Standard Sill

The standard outswing sill provides the most effective weather sealing for exterior applications, similar to raised sills typical to sliding or swinging patio doors. In the non-recessed application, the sill is installed on top of the sub floor and then the finished floor is built up on the interior to minimize the height of the sill. It is important that the exterior surface level is lower than the sill to enable water drainage from the sill to the exterior.
